

Specify the Core Subject Matter & Conceptual Depth

Ask for a rigorous definition of Artificial Intelligence that goes beyond simple explanations. Make sure the AI talks about the four pillars. The four cognitive pillars are perception, reasoning, learning and autonomy. The AI must also cover the sub-disciplines. The primary sub-disciplines are Machine Learning, Deep Learning, NLP and Robotics. The AI should also explain the three tiers of capability. The three tiers of capability are Narrow AI, General AI and Superintelligence.

Enforce Strict Structural Hierarchy & Visual Scanning

Tell the response to avoid blocks of text. Ask for Markdown formatting. Use high-level section headers like `##`. Use bulleted lists for attributes. Include a comparison table for subfields. Make sure the information is easy to read at a glance.

Set Layout & Print Specifications for PDF Export

Say the output must fit on a page. Ask for modern typography. Suggest sans-serif fonts like Inter or system UI fonts. Make sure there is negative space. Set print margins like A4 or US Letter with 18–20mm margins. Make the design look professional for use in enterprise or academic settings.

Demand a Direct Client-Side Download Mechanism

Request a component or embedded viewer. Ask for a single-click action. Suggest using inline scripts or widgets. Use PDF-generation libraries, like jsPDF or html2pdf. Make it so the user does not have to format or print the page.

Require Raw Source Text & Modular Export Formats

Ask for the clean plain-text or Markdown content. Place it below the generator. Make sure the raw text is easy to use. Ensure it can be dropped directly into Google Docs, Microsoft Word, LaTeX or Notion. Avoid fighting with CSS quirks or markup artifacts.
